DNA 14 2 human genetic disorders from molecule to phenotype answers. The vast majority of organisms encode their genes in long strands of DNA (deoxyribonucleic acid). DNA consists of a chain made from four types of nucleotide subunits, each composed of: a five-carbon sugar (2-deoxyribose), a phosphate group, and one of the four bases adenine, cytosine, guanine, and thymine.

Sample answer: Genetic engineering can create transgenic organisms that secrete a human protein for medical use. First, the human gene that codes for the protein is injected into an egg from a donor goat. Then the egg is placed in a host goat where a transgenic goat develops. Finally, this transgenic goat produces milk
